ABSTRACT

In order to ascertain the quality of local distributed condoms, 105 samples were purchased from novelty stores, drugstores, and supermarkets from different counties and cities in Taiwan during the period from July to August 2001. The pin-hole tests were carried out following the methods listed in Chinese National Standard No. 13245. The results showed that all samples met the requirement mentioned above. This is the first time in the past ten years that no one sample failed the test. It means that the quality of condoms distributed in Taiwan market improved greatly.

Key words: Pin-hole test, Condom.
