Abstract

Two new species of *Diplommatina* (*Benigoma*), *D. (B.) shishanensis* n. sp. and *D. (B.) shuitianensis* n. sp., are described from Taiwan on the bases of shell characteristics. *Diplommatina (B.) shishanensis* n. sp. is characterized in having two parietalis, the outer parietalis short with an extending 0.125 whorl, the inner parietalis medium with an extending 0.139 whorl, 34-40 radial ribs on the last and penultimate whorls, and duplicated peristome. *Diplommatina (B.) shuitianensis* n. sp. is characterized in having two parietalis, the outer parietalis long with an extending 0.167 whorl, the inner parietalis short with an extending 0.125 whorl, 14-30 radial ribs on the last and penultimate whorls, pentagonal aperture and single peristome. An updated definition is provided for the subgenus *Diplommatina (Benigoma)* that was not well documented. A key is provided to identify all the seven species of the subgenus: five from Taiwan and two from Japan.
